                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence corresponds to the catalase HPII gene from E.coli. The gene was PCR amplified by primers AA228797-228798 and the amplified gene was inserted into the plasmid pET-20b for expression in an organism such as E.coli DH5alpha. The E.coli enzyme can be used as a control in sasays for the novel Beachlus thermoglucosidasius catalase (AA228794) of the invention. The catalase protein can be used for the decomposition of hydrogen peroxide contained in the residual disinfectant remaining in a contact lens solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GTCCATACCTTCCGACTTGTCACCGACGAGGCCAACTCGACCTTGGTCAAGTTTCGCTGG

                                                                                                                                                                                                                                                                  AAS51464
                                                                                    à
                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes themselves and the discovery of movel antibiotics, the essential consideration is also useful for the identification of potential argets invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to invention is also useful for the identification of potential new targets of or antibiotic development. The antisense nucleic acids can also be used to screen compounds in rational drug discovery and to obtain antibodies capable of binding to the expressed proteins. The proteins used in proliferation in actional drug discovery for homologous nucleic acids which are required for cell proliferation in cessential prokaryotic cellular proliferation protein.

Compared to a sequence data for this patent did not form part contraction in the printed specification, but was obtained in electronic form the contraction of the printed specification, and to contract the secure of form the printed specification and the contraction in the contraction of the printed specification, but was obtained in electronic

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella of pneumoniae, Pseudomonasa aeruginosa and Enterococcus faecalis. The contential is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to deminify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Colf the printed specification, but was obtained in electronic

Pred. No. is the number of results predicted by chance to have

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                 Score

Best Local :
A probe (AAQ73433) or its complement (AAQ73436) and corresponding RNA sequences (AAQ73437 and AAQ86436) used for the specific detection of all strains of Histoplasma capsulatum (H.C.). The probes are manufactured complementary to the H.C. 18s rRNA or rDNA gene. This region also rorresponds to the bases 172-193 of Saccharomyces cerevisiae 18s rRNA. The probe is specific for H.C. and can be used to distinguish the fungus from all others, even its nearest phylogenetic neighbour Blastomyces dermatitidis. Nucleic acid hybridisation of the specific probe is enhanced by the use of helper probes (AAQ73434-5). This method allows the detection and/or the quantitation of H.C. from samples e.g. body
                                                                                                                                                                                       Claim 9; Column 12;
                                                                                                                                                                                                                    quantitation in body fluids, etc.
                                                                                                                                                                                                                              Hybridisation probe specific for Histoplasma capsulatum - allowing differentiation from all other fungi for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences (AAQ73437 and AAQ86336) used for the specific detection of all strains of Histoplasma capsulatum (H.C.). The probes are manufactured complementary to the H.C. 185 rRNA or 7DNA gene. This region also corresponds to the bases 172-193 of Saccharomyces cerevisiae 185 rRNA. The probe is specific for H.C. and can be used to distinguish the fungus from all others, even its nearest phylogenetic neighbour Blastomyces dermatitidis. Nucleic acid hybridisation of the specific probe is enhanced by the use of helper probes (AAQ73434-5). This method allows the detection and/or the quantitation of H.C. from samples e.g. body

                                                                                               A probe (AAQ73433) or its complement (AAQ73436) and corresponding RNA sequences (AAQ73437 and AAQ86436) used for the specific detection of all strains of Histoplasma capsulatum (H.C.). The probes are manufactured complementary to the H.C. 18s TRNA or TDNA gene. This region also corresponds to the bases 172-193 of Saccharomyces cerevisiae 18s TRNA. The probe is specific for H.C. and can be used to distinguish the fungus from all others, even its nearest phylogenetic neighbour Blastomyces dermatitidis. Nucleic acid hybridisation of the specific probe is enhanced by the use of helper probes (AAQ73434-5). This method allows the detection and/or the quantitation of H.C. from samples e.g. body fluids, tissue samples, soil and water.
                                                                                                                                                                                                                                                                                    Hybridisation probe specific for Histoplasma capsulatum - allowing differentiation from all other fungi for detection quantitation in body fluids, etc.
                                                                                Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                   A probe (AAQ73433) or its complement (AAQ73436) and corresponding RNA sequences (AAQ73437 and AAQ86436) used for the specific detection of all strains of Histoplasma capsulatum (H.C.). The probes are manufactured complementary to the H.c. 18s rRNA or rDNA gene. This region also corresponds to the bases 172-193 of Saccharomyces cerevisiae 18S rRNA. The probe is specific for H.c. and can be used to distinguish the fungus from all others, even its nearest phylogenetic neighbour Blastomyces dermatitidis. Nucleic acid hybridisation of the specific probe is enhanced by the use of helper probes (AAQ73434-5). This method allows the detection and/or the quantitation of H.c. from samples e.g. body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hybridisation probe specific for Histoplasma capsulatum - allowing differentiation from all other fungi for detection quantitation in body fluids, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic.

CC expression of the same genes in one or more second filamentous fungal CC cells. The method uses fluorescence-labeled nucleic acids isolated from the Fr cells and a substrate of expressed sequence tags (EST). The ESTs CC are used in the methods for monitoring differential expression of genes CC in a first filamentous fungal (FF) cell relative to expression of the genes in one or more second filamentous fungal cells. Monitoring CC same genes in one or more second filamentous fungal cells Monitoring CC the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be CC discovered, possible functions of unknown open reading frames can be clientified and gene copy number variation and stability can be consitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore compineering. Using ESTs provides several advantages over genomic or crandom cDNA clones including elimination of redundancy as one spot on an CC random cDNA clones including elimination of redundancy as one spot on an CC array equals one gene or open reading frame, and organisation of the carray equals one gene or open reading frame, and organisation of the canalysis of the results. AAF01748 to AAF11247 represents ESTs from Aspergillus oryzae; and CC altitate to AAF11873 represents ESTs from Aspergillus oryzae; and CC altitate to AAF114878 represents ESTs from Aspergillus oryzae; and call to AAF114879 to AAF124878 represents ESTs from Aspergillus oryzae; and call to AAF114878 to AAF114878 represents ESTs from Aspergillus oryzae; and CC altitate to AAF14878 represents ESTs from Saccoder, which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         OVON)

The method is invasive infections in hematological-oncological patients with long-term overlapping primers, this process provides efficient and reliable detection of Aspergillus in clinical situations. It is specific for Aspergillus (it detects the species terreus, niger, versicolor, clavatus, other genera). This sequence represents the DNA sequence of Aspergillus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AA199683) and H37Rv (AA199683). The method is useful for evaluating strain variation (tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and H37RV (AAI99682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO

Q
                                                                                                The invention relates to a spatially-addressable set of single exon cc nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting cc the probes with a collection of detectably labelled nucleic acids cound to each probe of the microarray. The probes are useful for cc verifying the expression of regions of genomic DNA predicted to cc encode proteins. They are useful for gene discovery, and for cc expression analysis is useful for prognosing breast disease. Gene cc expression analysis is useful for assessing the toxicity of chemical cc diversity of probes for measuring gene expression, with far less bias cc crapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Cc Note: The sequence is a single exon nucleic acid probe of the invention. The specification, but was obtained in electronic format directly cc from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; SEQ ID NO 3302; 639pp + sequence listing; English

                                                                                                                                            measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease.
                                                                                             Sequence 454
                                                                                                                                                                                                                                                                                                                                                                                                                                               04-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

(SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

The present invention relates to human single exon nucleic acid

probes

Note:

The sequence ication, but

data for this patent did not form was obtained in electronic format

   Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BB BB
